

Paper is made in giant rolls in paper mills.

From pulp to paper

We make paper from wood. In factories called paper mills, tree trunks are ground up into pulp—a mushy substance that is then pressed, dried, dyed, and formed into paper products.

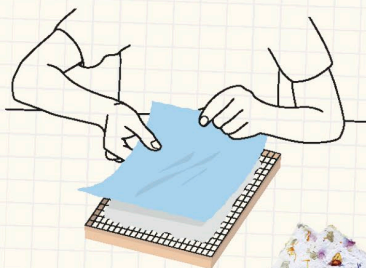

MAKING PAPER

You can recycle used paper to make new paper. To do this at home you will need newspaper, wire netting that an adult has nailed to a frame, a saucepan, and an old cloth or towel.

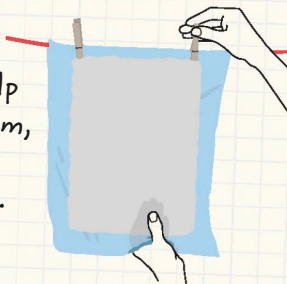

1. Shred clean newspaper into a saucepan of water. **ASK AN ADULT** to boil it until it turns into a mushy pulp.

2. When the pulp cools, pour it onto the wire netting. Let the water drain and turn the wet paper onto a clean cloth.

3. Once the pulp has become firm, hang the new paper up to dry.

You can decorate your new paper with petals or leaves.
