

Program flow

Before learning more about Python, it's important to understand how programs work. The programming basics learned in Scratch can also be applied to Python.

From input to output

A program takes input (information in), processes it (or changes it), and then gives back the results (output). It's a bit like a chef taking ingredients, turning them into cakes, and then giving you the cakes to eat.

△ Program flow in Python

In Python, the keyboard and mouse are used to input information, which is processed using elements such as loops, branches, and variables. The output is then displayed on the screen.
