

- 3** Print a random silly sentence by running the “pick” function once for each of the three lists. Use the “print” command to show the sentence on the screen.

Add an “a” so that the sentence makes sense (see below)

```
print(pick(name), pick(verb), 'a', pick(noun), end='.\\n')
```

- 4** Save and run the program to get a silly sentence made from the lists of names, verbs, and nouns.

Neha kicks a bicycle.

The sentence is randomly selected each time the program is run

This adds a period at the end, while the “\\n” starts a new line

Silly sentences forever!

A forever loop can be added to the silly sentences program to keep it running forever, or until the user presses “Ctrl-C” to escape the loop.

- 1** The program keeps printing silly sentences if the “print” command is wrapped in a “while True” loop.

```
while True:
    print(pick(name), pick(verb), 'a', pick(noun), end='.')
    input()
```

Wraps the print command in a loop

Prints a new sentence every time the “Enter” key is pressed

- 2** The “input()” function waits for the user to press the “Enter” key before printing another sentence. Without this it would print them too fast to read.

Sam rides a lion.
Neha kicks a plane.
Lee buys a bicycle.

The program will keep on creating random sentences

EXPERT TIPS

Readable code

It’s very important to write a program that can be easily understood. It makes the program easier to change in the future because you don’t have to start by solving the puzzle of how it works!
