

8 When the string representing the instructions for the house shape is passed into the String artist, it shows this output in the shell window.

```
>>> string_artist('N-L90-F100-R45-F70-R90-F70-R45-F100-R90-F100')
```

```
N : N 0
```

Resets the screen and puts the turtle back at the center

```
L90 : L 90
```

```
F100 : F 100
```

For command "F100", the command type is "F" and "num" is "100"

```
R45 : R 45
```

```
F70 : F 70
```

This makes the turtle turn 45 degrees before drawing the roof

```
R90 : R 90
```

```
F70 : F 70
```

This command makes the turtle draw the right-hand side of the roof

```
R45 : R 45
```

```
F100 : F 100
```

```
R90 : R 90
```

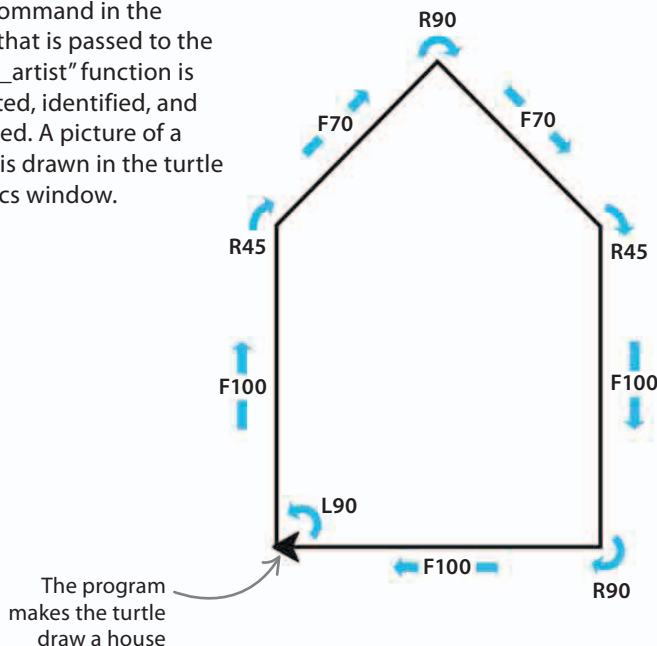

The turtle turns 90 degrees right, ready to draw the bottom of the house

```
F100 : F 100
```

The turtle commands are all separated by a "-"

9 Each command in the string that is passed to the "string_artist" function is extracted, identified, and executed. A picture of a house is drawn in the turtle graphics window.

REMEMBER

Commands

Here's a reminder of the turtle commands in this program. Some of these are only one letter long, while others include a number telling the turtle how far to travel or turn. Each time you activate "string_artist", it adds to the drawing, until "N" clears the screen.

N = New drawing

U/D = Pen Up/Down

F100 = Forward 100

B50 = Backwards 50

R90 = Right turn 90 deg

L45 = Left turn 45 deg
