Now update the main game loop to use the functions you have just created. Remember that the order is important, so make sure you put everything in the right place. Then run the code. Bubbles should burst when they hit the sub. Check the shell window to see the score.

```
score = 0
#MAIN GAME LOOP
while True:
    if randint(1, BUB_CHANCE) == 1:
        create_bubble()
    move_bubbles()
    clean_up_bubs()
    score += collision()
    print(score)
    window.update()
    sleep(0.01)
```

← Sets the score to zero when the game starts

← Creates new bubbles

← Adds the bubble score to the total

← Shows the score in the shell window—it will be displayed properly later

← This pauses the action for a very short time—try removing this and see what happens

EXPERT TIPS

Python shortcut

The code “score += collision()” is a shortcut for writing “score = score + collision()”. It adds the collision score to the total score, then updates the total score. Code like this is common, so a shortcut is useful. You can also do the same thing using the “-” symbol. For example, “score -= 10” is the same as “score = score - 10”.
