

Artificial Intelligence

Intelligent programs do more than just make computer games fun. Artificial Intelligence (AI) is being used to provide better healthcare, as well as helping robots operate in places too dangerous for humans to go, such as war zones and areas destroyed by natural disasters.

△ Medicine

Systems are able to analyze a huge database of medical information and combine it with details from the patient to suggest a diagnosis.

△ Bomb disposal

Many soldiers' lives can be saved by using an intelligent robot to safely dispose of a bomb in an area that has been cleared of people.

Supercomputers

Supercomputers—used by high-tech organizations such as NASA—combine the power of thousands of computer processors that share data and communicate quickly. The result is a computer that can perform millions of calculations per second.

△ How it works

Problems are broken into smaller problems that are all worked on separately at the same time by different processors. The results are then combined together to give the answer.

REAL WORLD

Weather forecast

Weather patterns are very unpredictable. Supercomputers crunch the huge amounts of data needed to accurately predict what will happen. Each processor in the supercomputer calculates the weather for a small part of the map. All the results are then combined to produce the whole forecast.
