

Game ingredients

The most common ingredients in games are often combined into a “game engine”. Engines provide an easy-to-use base so that new games can be developed quickly.

▷ Story and game logic

All games must have a good story and some sort of goal to aim for, such as saving the princess. Well-designed game logic keeps players interested.

◁ Game physics

In a virtual world, the rules of the real world, such as gravity and collisions, must be re-created to make the game more believable.

▷ Controls

Familiar controls that make sense to the player help make a great game. Good control design makes the player forget that they are using a controller.

△ Artificial intelligence

Human players often play alongside or against computer-controlled players. Artificial intelligence programming allows these characters to respond realistically.

△ Graphics

As games become more realistic their graphics must become more complex. Body movements, smoke, and water are particularly hard to get right.

▷ Sound

All of the words spoken in the game must be recorded, as well as the background music and the sound effects that change throughout the game.

REAL WORLD

Serious games

Games are being used for more than just fun. Pilots, surgeons, and soldiers are just some of the professionals who use games at work for training purposes. Some businesses even use strategy games to improve their employees' planning skills.
