

How to build an app

There are many questions to answer before building an app. What will it do? What devices will it run on? How will the user interact with it? Once these questions are answered, building an app is a step-by-step process.

1 Have an idea

Any idea for a new app must be well suited to mobile devices. It might be a completely new idea, or it could just be an improvement on an already existing idea to make a better version.

Mac

Android

Windows

2 Which operating system?

Will the app target a certain type of mobile device? Coders can often use tools that let them write their application once and then adapt it for different operating systems.

3 Learn to make apps

Whichever platform the app will run on, a coder needs to learn the language and other skills needed to build a good app. Online tutorials and local coding clubs can help.

4 Create the program

Good apps take time to make. A basic version might be working in weeks, but for an app to be really successful, it will need to be developed for a few months before its release.

5 Test it

Users will quickly get rid of an app if it contains bugs. Putting in tests as part of the code, and getting friends and family to try out the app can help clean up any errors before the app is released.
