

## What malware does

Viruses, worms, and trojans are all types of malware that are created to get into your machine, but what do they do once they have infected their target? They might delete or corrupt files, steal passwords, or seek to control your machine for some larger purpose as part of an organized “zombie botnet”.

### ▷ **Zombie botnets**

Botnets are collections of infected computers that can be used to send spam emails, or flood a target website with traffic to bring it crashing down.

## Good software to the rescue

Thankfully, people aren't defenseless in the fight against malware. Anti-malware software has become big business, with many providers competing to provide the best protection. Two well-known examples are firewalls and antivirus programs.

### △ **Antivirus programs**

Antivirus software tries to detect malware. It identifies bad programs by scanning files and comparing their contents with a database of suspicious code.

### △ **Firewalls**

Firewalls aim to prevent malware and dangerous network traffic from reaching your computer. They scan all incoming data from the Internet.

## Hackers

Coders that study and write malware are known as “hackers”. Those who write malware to commit crimes are known as “black-hat” hackers, and those who write programs to try to protect against malware are known as “white-hat” hackers.
