

Which direction?

The cat is now marching left and right across the screen. It's possible to change the cat's direction, so it walks up and down, or even diagonally. The "Motion" blocks can be used to make a game of cat and mouse.

4 Heading the right way

Drag the "point in direction" block into the scripts area and open its drop-down menu. There are four directions to choose from. Or, click on the number in the window and type in a new direction.

△ Compass

Directions are measured in degrees, from 0° at the top. You can use any number between -179° and +180°.

The cat will follow the mouse-pointer

5 Cat and mouse

Remove the "move 10 steps" and "if on edge, bounce" blocks from the script. Now drag a "point toward" block into the "forever" block. Open the menu and choose "mouse-pointer."

6 Chase the mouse

Can the cat catch the mouse? Drag a "move 10 steps" block into the "forever" loop. Now the cat walks toward the mouse-pointer.

REMEMBER

Sprites

Sprites are objects in a Scratch program that you can move around (see pp.28–29). Every new project starts the cat sprite, but you can add cars, dinosaurs, dancers, and all sorts of other sprites from the library. You can even have a go at designing your own.
