

Sizes and effects

Scripts can be used to change the size of a sprite and add special effects to it.

change size by 10
Type in positive numbers to make sprites bigger and negative numbers to make them smaller

set size to 100 %
Higher numbers make sprites bigger and lower numbers make them smaller. 100 is normal size

△ Changing a sprite's size

These two blocks can be used to make a sprite bigger or smaller, either by a set amount or by a percentage of its size.

Choose the type of effect from the drop-down menu. The "pixelate" effect makes the sprite become blurred

change pixelate effect by 25
Change the numbers in the blocks to set how strong the effect is

set color effect to 0
Each color is represented by a number. Change the number to set the color

clear graphic effects
Resets all the effects

△ Adding graphic effects

The graphic effects in Scratch can be used to change a sprite's appearance or distort its shape. They're fun to experiment with.

Using effects to teleport

Add a ghost sprite from the "Fantasy" category of the sprite library, and create the script shown below. It makes the ghost appear to teleport when clicked.
