

6 The next step is to add a flying bat and make it drop to the ground if it's hit by the bananas. Add "Bat2" from the sprite library, then create a new variable called "Speed" (for the bat sprite only). To create a new variable, first click the "Data" button in the blocks palette, and then select the "Make a Variable" button. Untick the box by the "Speed" variable in the "Data" section so it doesn't appear on the screen.

Name the new variable "Speed"

This variable will only be used with the bat sprite

7 Add the below script to the bat. In the main "forever" loop, the bat moves to a random position on the left of the stage, chooses a random speed, then moves backward and forward across the stage until the bananas hit it. When the bat is hit, it drops to the ground.

when green flag clicked

set rotation style left-right

forever loop:

- go to x:** -300 **y:** pick random 1 to 100
- point in direction** 90
- set** Speed **to** pick random 1 to 20
- repeat until** touching Bananas?
- move** Speed **steps**
- if on edge, bounce**
- broadcast** hitbybananas
- point in direction** 180
- repeat** 40
 - move** 10 **steps**

Annotations:

- This keeps the bat sprite upright (points to rotation style)
- Start of the bat's main loop (points to the start of the forever loop)
- The bat starts off on the left of the stage, at a random height (points to y: pick random)
- Sets the bat's direction to right (points to point in direction 90)
- Picks a random speed (points to pick random 1 to 20)
- This makes the bat keep moving until it's hit (points to repeat until touching Bananas?)
- Drag the "Speed" variable from the "Data" section into this block (points to move Speed steps)
- Create this "broadcast" block to tell other sprites that the bat has been hit. This will be useful later in the project (points to broadcast hitbybananas)
- Sets the direction of the bat to down (points to point in direction 180)
- Makes the bat fall down and off the stage (points to move 10 steps)
