

Closest star

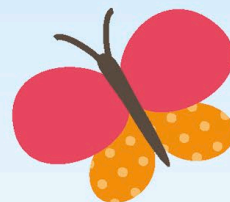

The Sun is a star, but it's much closer to Earth (where we live) than other stars we see at night.

It's so close, it's too bright for us to look at – even when we wear sunglasses.

When the Sun is in the sky it's daytime.

...and rises in the east.

Staying still

Every day it looks like the Sun rises in one place and sets in another. But it's actually the Earth that's moving, while the Sun stays still.

A cockerel says "cock-a-doodle-doo!" when the Sun rises.
