

Printers

Printer problems are often caused by a lack of paper or paper jams. Most printers have warning lights and displays to indicate these issues. Another possible issue is low ink or toner levels. Opening the printer settings in the Control Panel in Windows, or System Preferences on a Mac will reveal more specific error messages.

△ Quality issues

Bad quality printing can be caused by badly aligned or clogged print heads. Printers usually come with software that allows users to diagnose and fix these types of issue.

Sound and webcams

Problems with sound and webcams can be frustrating, particularly for users trying to take part in online meetings. Checking the computer's settings for sound output and input might help to solve the problem. Forgetting that headphones are plugged in can also be the source of missing sound. Some computers and headphones have built-in microphones, but a computer may still need an external microphone to be plugged in.

△ Webcam connectivity

People often cover the webcam when not in use to protect against hackers. If so, it's important to remember to uncover it before use.

Wi-Fi and data

Wi-Fi connections can sometimes be temperamental. Check that the computer is actually connecting to the correct Wi-Fi and not a neighbouring one with a weaker signal. If there seems to be no signal at all, try switching the router off for a few seconds and then turn it back on. If a Wi-Fi connection seems slow, there are speed-test websites online that can determine the current speed. A slow connection is usually short-lived and mostly due to issues with the internet provider, possibly affecting many users in a local area.

▷ Data usage

Some internet providers, and many mobile phone contracts, limit the amount of data customers can use each month. It therefore is useful to know how much data different online activities use.
