Getting involved

Most young people today are very comfortable using computers and technology, so it's easy to assume there's no point in studying computing. However, computer science isn't simply about using digital tools, it also involves exploring how these technologies work. Studying computer science can help young people develop skills to solve problems, invent new things, and create new technologies for the future.

▷ No limits

People without computing skills are limited to using the websites, apps, and games that are already available. People with computing skills, on the other hand, are in a position to turn their ideas into reality, and to make the things that will shape the future of computers.

The world is digital

The world is becoming increasingly digital. Computers control a lot of the basics of modern life, from paying for things to driving cars, and from hospitals to satellites. Here are just a few of the ways in which computers control aspects of everyday life.
