

◁ Smart plant-monitor

Smart devices and appliances contain sensors that allow their internal computers to gather data. A smart plant-monitor can detect low levels of moisture in a plant's soil, and either message the owner or, if they have an attached reservoir, release some water automatically.

9:30 AM

Make coffee!

A smartphones can tell a connected coffee machine to start making coffee.

The user can receive an alert by the smart plant-monitor upstairs.

▽ App-based appliances ▽

Connected appliances allow users to check the status of things in their home, wherever they are. A connected refrigerator can keep track of what is inside it, and if the food is still safe to eat. A connected coffee machine can prepare coffee while the owner is getting dressed in the morning.

A coffee machines can receive a command from the user's smartphone.

▽ Robots in the home

Home robots include a vacuum cleaner with Wi-Fi access that can be controlled from a smartphone app, a robot lawn mower, and a robot alarm clock on wheels that drives away, forcing its owner to get out of bed to switch it off.
