

SAU LAN WU

Chinese-American physicist

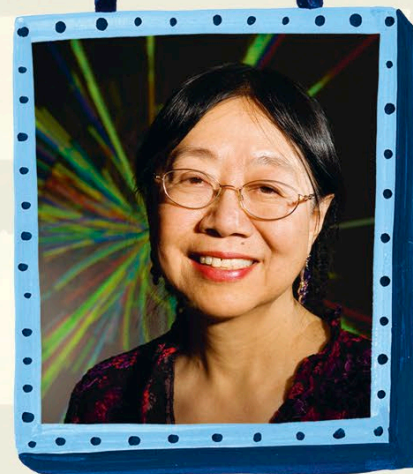

Early 1940s–present

Sau Lan Wu says that if something doesn't work out in life, you should never give up. Just keep going, and something else will come along and surprise you. This happened over and over again for Sau. She began life in poverty, sleeping in the back of a shop in a very poor area of Hong Kong. After high school, she applied to 50 American universities to study physics.

Only one accepted her—but one was all that Sau needed!

She was on her way to becoming a physicist.

Try to innovate.
Nothing will be easy.
But it is all worth
it to discover
something new.

Particles are boosted to almost the speed of light...

Particle colliders

The particles that make up atoms are invisible to human senses. Physicists find out about them by smashing bigger particles together in an accelerator and analyzing what happens.
