

NASIR AL-DIN AL-TUSI

Persian philosopher,
astronomer, and mathematician
1201–1274

Hundreds of years before Albert Einstein was born, the Islamic world already had a name that everyone knew meant genius—al-Tusi. When Nasir al-Din al-Tusi was just a boy, his dad passed away. It was his father's dying wish that Nasir would study hard.

Nasir did exactly that, and studied all kinds of different subjects, from mathematics and physics to philosophy and medicine. He was at the top of his class in everything! His wide-ranging talents led him to become an important figure in society who would be remembered for hundreds of years.

Nasir's careful measurements helped him to describe the circular movements of the planets in the night sky accurately.

Nasir studied old texts and ideas—such as those of the ancient Greeks—and improved on them.
