

Ettore Majorana
1906–?

Italian Ettore was a young scientist using his brilliant mind to understand atoms, when he suddenly vanished in 1938. The mystery has never been solved.

Had he kept working, many physicists think he could have made world-changing discoveries, like Isaac Newton or Albert Einstein.

Julie Makani
1970–present

An award-winning medical researcher in Tanzania, Julie works to make blood disorders better. She leads efforts to turn research into health policies and practices that improve the lives of patients living with a blood disorder called sickle cell disease.

Barbara McClintock
1902–1992

Barbara helped us to understand what genes are and how they work.

She proved that a genome (all genetic material of a living thing) is not fixed like beads on a string, but constantly being rearranged. This began a new field of science called cytogenetics, and won Barbara a Nobel Prize.

Mario J. Molina
1943–2020

Along with another scientist, Mexican chemist Mario showed how certain gases, called chlorofluorocarbons (CFCs), lead to the destruction of the ozone layer that protects the Earth from harmful solar radiation. Mario worked tirelessly to get CFCs banned from everyday use.

Leopold Ružička
1887–1976

Leopold studied the remarkable substances found in nature. He helped perfume makers put science into practice by making artificial versions of chemicals with strong smells. He later discovered how to produce important hormones that act as messengers in our bodies.

Katsuko Saruhashi
1920–2007

Raindrops falling down a window triggered Katsuko's curiosity about the science of our planet. She became a celebrated geoscientist who warned the world that testing nuclear weapons above ground polluted the Earth's air and oceans.

Ignaz Semmelweis
1818–1865

Ignaz was a Hungarian doctor who figured out that doctors were accidentally spreading infections in hospitals. By insisting that doctors wash their hands after treating each patient, Ignaz showed how bacterial infection could be controlled and prevented.

Helen Taussig
1898–1986

A learning difficulty called dyslexia, which makes it harder for some people to read and write, didn't stop Helen from becoming a brilliant doctor. She helped to develop an operation to correct a heart defect that stops some newborn babies from getting enough oxygen.
