

meteorologist

Scientist who studies the Earth's atmosphere and weather

microbe

Any living thing too small to see without using a microscope

molecule

Two or more atoms (tiny particles of a chemical element) bonded together

NASA

US government agency responsible for space missions and space-related research. Stands for National Aeronautic and Space Administration

naturalist

Someone who likes to observe or study living things in their natural environment

nuclear energy

Energy that is released when breaking the center of atoms apart

observatory

Place where astronomers study space

paleontologist

Scientist who studies fossils

Pangaea

Supercontinent that was formed from all of Earth's continents. It existed hundreds of millions of years ago and broke apart to form the continents we know today

particle

Very tiny part of something, even smaller than an atom

physics

Branch of science concerned with matter, movement, forces, and energy

pyroclastic flow

Eruption of hot gas, rocks, and ash that moves rapidly down a volcano's slopes

radiation

Movement of energy in the form of waves or particles. Sunlight, X-rays, and radio waves are all types of radiation. Some types can be harmful to living things

refraction

When light waves bend as they pass through a transparent object, such as a glass prism or window

scholar

Person who is an expert on a subject

species

Group of similar living animals or plants. Members of the same species look similar and can breed together to produce offspring

tectonic plate

Large, slow-moving piece of the Earth's crust

theorem

Statement in science that can be proved to be true

transform

To change or convert into something else

vaccination

Medicine that teaches the body how to fight off an infection

volcanologist

Scientist who studies volcanoes

X-ray

Invisible beams of light that pass through soft tissue, such as skin, but are soaked up by thicker tissue, such as bone

zoology

Study of animals
