

ALFRED RUSSEL WALLACE

British explorer, naturalist,
and biologist • 1823–1913

You've had a world-changing idea—now what?

How do you make sure that children will be learning *your* name in school in 150 years' time? Charles Darwin is famous for the theory of evolution by natural selection, but Alfred Russel Wallace came up with the same idea at the same time. Why did history almost forget him?

Alfred's family was not rich like Charles's family. Alfred dropped out of school at age 14 to earn money for his family. He became a surveyor, then a teacher. While teaching, Alfred read about Charles's voyage on HMS *Beagle* and decided to save up enough money to travel the world himself.

Alfred drew many sketches, which were published in his book *The Malay Archipelago*.

This is Wallace's flying frog, which was introduced to scientists by Alfred.

Many of the birds Alfred collected were new to the world of science.
