

CARL VON LINDE

German scientist
and engineer
1842–1934

Carl's refrigeration machines kick-started a new industry. People quickly found new ways to use them, such as for the very first human-made ice rink, in 1896.

It's hard to imagine life without fridges and freezers. They can be found in many homes around the world.

For thousands of years, people have extracted (taken out) all kinds of interesting things from rocks and soil. Carl von Linde was one of the first people to figure out how to extract useful substances from air! As a schoolboy, he visited a cotton mill and was captivated by the machinery. He decided to study mechanical engineering, but lost his place at college after taking part in a student protest.

Carl's teachers helped him get an apprenticeship instead. After working for companies that made steam engines, Carl began teaching engineering at universities. He set up a machine lab for his students that he also used for his own research.
