

FOREWORD

by Molly Bloom

Science communicator and host of public
radio's *Brains On!* science podcast for kids

When I was a kid, I had questions about everything. Little things like, what is dust made of? Or, why do apples get brown when they sit out? And also, the really, really big things—like, what was the very first life on the planet?

Or, where does the universe end?

Science is what happens when you let a question take you on a journey. The journey could happen mostly in your mind and on paper, like with Albert Einstein's famous thought experiments.

Maybe your eyes are all you need to observe and discover, like when Maria Sibylla Merian taught the world about the mind-blowing and beautiful transformations of insects.

Or maybe you'll find your questions can't be answered with the tools you have, like when Albert Baez invented a new kind of microscope that unlocked information that earlier scientists had only dreamed of.
