

Gravity pulls planets into orbit around the sun.

Gravity

Isaac thought of gravity as a force that pulls objects toward each other. He explained that every object has gravitational force, but the more massive an object, the stronger the pull.

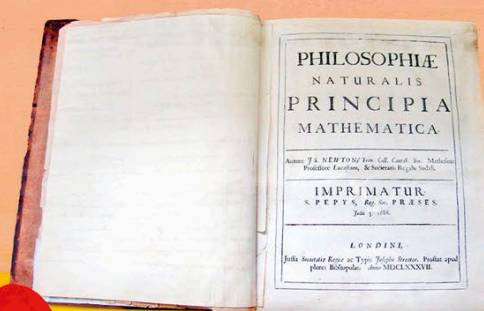

Isaac was said to have come up with his theory of gravity while watching an apple fall from a tree, but this is probably a myth!

As a teenager, Isaac Newton was put in charge of his family's farm. His mind, however, was on other things. He loved figuring out how mechanical objects worked, and how to build his own. His projects included a clock powered by water and a model windmill powered by a mouse! Finally, his mother decided he would be better suited to studying at university than running a farm.

Isaac was so focused on his work that he didn't spend much time with other people, and he was often distracted when they spoke to him. Unfortunately, a disease called the Great Plague spread across Europe a few years into his studies. The university closed, and Isaac got to work studying by himself.

Isaac's most famous book, the Principia, has 500 pages of brilliant ideas.

ISAAC NEWTON

English physicist • 1642–1727
