

A force for change

Isaac began to come up with many amazing ideas. He invented calculus, which is a mathematical method for figuring things out. He explored light, suggesting that it was made up of many colors. Isaac's most well-known discovery was gravity. This is the force that keeps us on the Earth and our planet circling the sun.

Isaac continued to study the invisible forces of the world. He wrote three "laws of motion" to explain why objects move as they do.

Rainbow of colors

To learn about light, Isaac passed beams of it through a glass prism. He discovered that light came out of the prism as different colors. Isaac used his findings to figure out that light is a mixture of colors.

In addition to ideas, Isaac came up with inventions, such as the reflecting telescope.

Isaac's pet dog, Diamond, once knocked over a candle and set fire to important work!

Isaac's ideas about gravity and motion help explain all sorts of things—from the movement of planets to the speed of sound. Whenever someone throws a football, drives a car, or launches a rocket, Isaac's laws of motion explain how it will move.

Isaac also changed the way science is done. He conducted experiments to test his ideas, which was unusual at the time. Now, scientists rely on experiments to help prove their ideas.
