

MICHAEL FARADAY

English natural scientist
1791–1867

Michael Faraday was born in London, England, at the beginning of the Industrial Revolution—a time when lots of new machinery was being invented to increase the speed of manufacturing. Like many children at the time, Michael left school at age 13 to begin earning money. For seven years, he learned how to make books as an apprentice bookbinder. But it was what was inside the books that would interest Michael the most. He read one book about science and was hooked.

Michael began seeking out science books to teach himself about the subject. At 20, he watched a public talk given by a famous scientist named Humphrey Davy. Michael was fascinated and decided to write to Humphrey to share his own questions and ideas. A year later, he became Humphrey's assistant.

Making electricity

Using his knowledge about electricity and magnetism, Michael made an electric motor—a machine that converts electrical energy into movement energy. He then invented the dynamo—the first generator that converted movement into electricity.

Michael used coils of wire to create electromagnets, which are metal objects made magnetic by electricity.
