

ALBERT EINSTEIN

German-born physicist
1879–1955

Albert realized that space and time are both part of the same thing—space-time.

Albert wasn't the type of physicist that gazes at stars or drops balls off towers to see how they fall. He was a theoretical physicist who explored the universe in his mind. His "thought experiments" involving light and gravitational force helped him come up with new theories to explain how the universe works. Albert used math as a language to describe the universe, and to test his ideas.

In just one year, Albert published theories that changed the way we understand light, atoms, moving objects, energy, time, and gravity. He became a scientific superstar and more than 100 years later, his last name is still used to mean "genius."

Airy atoms

Albert realized that the specks of dust you see in a beam of sunlight are being pushed around by jiggling atoms of air. This was the first proof that atoms are real.
