

ERWIN SCHRÖDINGER

Austrian physicist and philosopher
1887–1961

Science doesn't have to be done indoors. Next to the beautiful Lake Zürich, in Switzerland, Erwin Schrödinger conducted experiments in his mind. In the summertime, he even delivered classes in swimming trunks on a beach by the lake! His experiments used math to describe and predict things that happen in the universe.

Erwin was particularly interested in figuring out what goes on inside atoms. He hoped that the behavior of tiny particles would explain some of the weird and wonderful things in the world. For example, he figured out why substances glow with specific colors of light when they get a boost of light or heat energy.

$$H(t)|\psi(t)\rangle = i\hbar \frac{\partial}{\partial t} |\psi(t)\rangle$$

Erwin's ideas, written in the language of mathematics, were the beginning of a new type of science that focused on how particles behave — quantum mechanics.
