

Your baby at...
5-6 months

Your baby's brain is *developing* at the fastest rate it ever will as his **awareness** of the world develops. His *language skills* are **improving** as you keep eye-to-eye contact with him, **point out** things to him, **describe** them, and **repeat** yourself. He will also start to **experiment** with *vowel sounds*. As his *physical strength* improves, he may also be preparing to *sit up unaided*.
