

Light and shade

Lay your baby on her back near a window, maybe with a tree directly outside, where she can look up and gaze at the contrasts in light and shade. In these first weeks she can already determine patterns and strong contrasts in tone.

Stick your tongues out

Catch your baby's attention and stick your tongue out every 20 seconds or so. Although it may take a minute or two, she should respond by sticking her tongue out at you!

Ask questions

Jot down any questions or concerns about your baby that come to mind so you have them on hand and don't forget about them while your pediatrician is with you.

Tracking game

During her first month, your baby's eyesight improves from only seeing things close-up to being able to focus about 8–15 in (20–35 cm) away—the right distance to be able to see your face when you hold and feed her. Stimulate her brain and sharpen her visual skills by getting her to follow your face with her eyes. Hold her in your arms, attract her attention by talking to her, slowly move your head from side to side, and see if she can track your head movements.
