

317 Calculate a tree's height

30
MINS

Have you ever wondered how tall a nearby tree is? Grab a friend and a stick and find out. If your measuring tape is too short, measure in stages and add everything up for the total height.

What you need

- A straight stick
- A friend
- Measuring tape

1 Face the tree. Hold the stick straight out in front of you. Move closer or farther away until the stick top is level with the top of the tree and the trunk-base lines up where you're holding the stick.

2 Get your friend to stand by the tree, facing you, so that his or her feet are level with the base of your stick. Turn the stick through a 90 degree angle to your right. The stick base should still be lined up with the tree base.

3 Have your friend walk away from the trunk toward the left. Stop him when he reaches the end of the stick. Measuring that distance will give you the tree's height.

Hold the stick as level as possible

318 Make a tire swing

20
MINS

Ask an adult to help you. Find an old tire and tie a length of strong rope securely around it. Tie the other end to a sturdy branch. Be sure you can reach the swing easily from the ground.

You can sit inside or on top
