

Colorful crests

By the time the young pterosaur reached adulthood, its brightly colored crest was fully developed and may have been displayed to attract mates. Adults traveled long distances, searching for food and water.

Nest and eggs

Every year, the female Caiuajara returned to the same place to nest and lay her eggs. These eggs were soft-shelled and too delicate to be sat on—so the mother may have kept them warm under a mound of vegetation or buried them in sand.

As vegetation rots, it produces heat—this kept the eggs warm.

Fossil Pterosaur fossils show that their bones were hollow with thin walls, making them very light. This helped pterosaurs fly.

Oasis An oasis is created in the desert when water seeps up to the surface. This makes a fertile area for plants to grow and animals to drink and feed. Fossils found near oases tell us that Caiuajara lived near them.
