

Destroying habitats

We use around 30 percent of all land for food, animal feed, and energy. The clearing of forests to create more land is called deforestation, and this has led to the loss of almost half of all trees. It also threatens the homes of many animal and plant species.

Hunting

Hunters kill elephants for their ivory, tigers for their skin and bones, and rhinos for their horns. This practice, which kills millions of animals each year, is causing many species to die out, or go extinct.

Species become extinct every day because of human activity.

... and solutions

Green energy

New technology allows us to generate energy without increasing global warming and pollution. Environmentally friendly—or “green”—energy sources include the wind, the waves, and the sun.

Wild farming

We can increase the variety of plants and animals in an area by growing diverse crops and restoring habitats for birds and pollinators—animals that fertilize plants. This practice is called wild farming.

Cutting down on waste

Recycling is the process of converting waste into new materials. Coupled with reusing objects instead of throwing them away, recycling helps preserve our resources and protect the environment.
