

Seasons

Some parts of the world have **four seasons**: spring, summer, fall, and winter. Other places on Earth are always warm and have a dry and a wet season. Each season brings different **weather**.

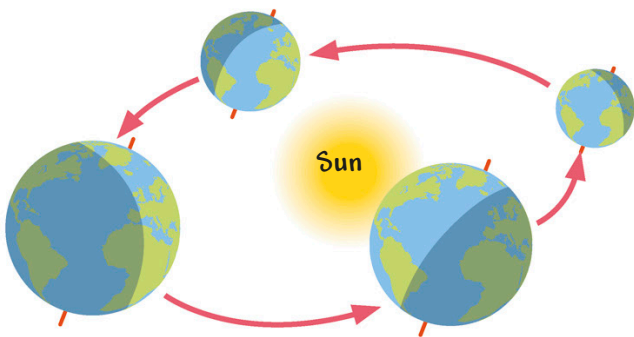

Spring

In spring, the days start to become longer and warmer. More sunlight and rain help plants to grow. Spring is the season when plants and trees grow new flowers.

Winter

The coldest season also has the shortest days. Some trees are bare in winter, and there can be snowstorms and freezing temperatures.

Why seasons happen

Earth is tilted as it travels around the sun. At different times of the year, some places get more sunlight as they lean toward the sun and then less sunlight as they lean away. This causes the seasons to happen.
