

Only a little of Earth's water is fresh water. It is a precious resource, so we must not waste it. Here are some ways to be more water-wise:

- Turn off the faucet when you're brushing your teeth.
- Take a shower instead of a bath.
- Tell an adult if you see a water leak.

Water makes up more than half your body's weight!

Washing

We use soap and water to clean ourselves. To keep germs away, we wash our hands before handling food and after going to the bathroom.

Laundry

To get rid of dirt and stains, washing machines churn and spin clothes around with water and a type of soap called detergent.

Drinking

We lose water when we breathe, sweat, pee, and poop. To stay healthy, we need to drink plenty of water each day to replace what we lose.

Cooking

We use water in the kitchen to boil and steam food. Then we use more water to wash dishes.

Swimming

Splashing and swimming in a pool is fun, and it's good exercise, too! Special chemicals are added to pool water to kill germs.

River

Rivers flow from hills and mountains to lower land, getting bigger along the way. They wind across the land until they meet the sea.

Glacier

Glaciers are like rivers of ice that move downhill from high mountains. There are also huge sheets of ice in polar regions.
