

States of matter

Everything on Earth is made of tiny parts, or **particles**, of matter. The three main states of matter are **solid**, **liquid**, and **gas**. The particles in each state behave in different ways. Matter can change from one state to another.

When water is boiled, it gets so hot that some of it turns into water vapor.

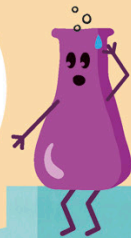

Matter magic

Water vapor is invisible, but it is in the air all around us. When it cools, it condenses into water droplets as clouds, fog, or rain.

Water vapor condenses on cold windows.

A gas has no shape and spreads out to fill any container.

Deposition

Condensation

Gas

When liquid water is heated to a high enough temperature, it turns into a gas. This gas is called water vapor. A gas becomes a solid in a process called **deposition** and a liquid in a process called **condensation**.
