

OCEAN SIZES

The five oceans are connected to one another, and range in size from the Arctic Ocean, the smallest, to the mighty Pacific Ocean, which covers more than a third of the planet's surface. This diagram shows how the areas of the five oceans compare. The Pacific is almost as large as all the other oceans combined.

SALTY WATER

While 96.5% of seawater is pure water, the other 3.5% is made up of various chemicals called salts. The most important of these is sodium chloride, used to make sea salt.
