

Evolution of life *continues...*

540 million years ago

ARMED FOR BATTLE

Suddenly thousands of new invertebrates burst onto the scene. An evolutionary arms race begins as species acquire hard shells, teeth, eyes, spines, guts, and feet. It's eat or be eaten now.

380 million years ago

ON THEIR TOES

Fish prop themselves up on their fins to breathe in air and develop a new skill—walking. Some set up home on land as the first amphibians. Crawling insects also move onto land.

300 million years ago

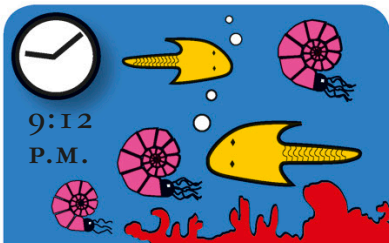

TOUGH SHELLS

Growing a dry, scaly skin and making a tough, leathery shell for their eggs enables some amphibians to breed on land. They turned into reptiles.

BONY BODIES

The first vertebrate animals appear in the form of jawless fish. Simple skeletons can support a muscly body that allows faster movement and much bigger body sizes.

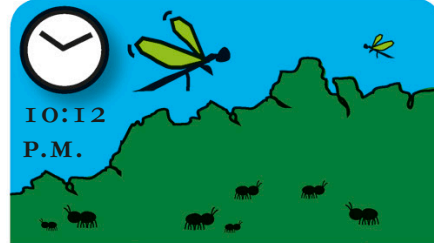

530 million years ago

HEADING OUT

Simple land plants begin to put down roots and a few brave crabs and scorpions start to investigate drier surroundings. This is a wise move since fish now have jaws!

450 million years ago

IN THE TREETOPS

Plants start to get bigger and forests of primitive trees grow in swamps around the coast. Some develop seeds and spread farther inland. Insects evolve wings and take to the skies.
