

After 9 p.m., *evolution* really began to *speed up*!

155 million years ago

TAKING TO THE SKIES

A group of feathered dinosaurs learn how to fly and evolve into birds. Sharks, reptiles, and amphibians start to look like their modern forms and insects begin to pollinate flowering plants.

250,000 years ago

LAST OF THE LINE

Homo sapiens, or modern man, emerges from a long line of early humans that have learned to stand and walk on two feet. He co-exists with Neanderthals, another human species, until they inexplicably die out 25,000 years ago.

MONSTER REPTILES

The planet is full of reptiles—they fly, they swim, they make the ground shake. This is the time of the dinosaurs, some of which become enormous. Flowering plants, conifers, cycads, and ferns provide them with giant bushes to lurk in.

240 million years ago

RISE OF THE MAMMALS

The combination of a huge asteroid hitting the earth and volcanic activity wipe out the dinosaurs and provide an opportunity for tiny mammals to take over. The first line of human ancestors start to diverge from apes.
