BALD
EAGLE

Penthouse views

Nests are built by birds to lay their eggs in. They vary from little more than a few thrown-together twigs to elaborately woven structures. The smallest, no bigger than half a walnut shell, are made by hummingbirds. The largest are built by bald eagles, who add new twigs every year until the nest weighs more than a ton. Sociable weaver birds make nests that can house up to 300 birds.

Designer apartments

Social insects, such as termites and bees, often live together in large colonies. Certain species of termite mix mud and saliva to build huge structures that have many chambers and even air conditioning to provide a steady flow of air through the tower. Bees and wasps build nests out of wax, mud, or chewed wood in a cavity or even under a large leaf in the tropics. They then build thousands of hexagonal cells to hold their eggs.

MOUND

Underground abode

Burrows are used by many animals for shelter from the weather, but others sleep and breed there, only coming out to look for food or to find a mate. Some, such as moles or worms, spend their whole lives below ground. Empty burrows also provide a ready-made home for non-diggers.
