

Humans have *conquered every continent*, taking advantage of Earth's resources in ways that no other organism can. We have *explored the oceans* and even *skyrocketed* into our closest region of *space*. But the **real survivors** are those organisms that live in *our planet's most hostile places*: frozen in ice, deep underground, or in acid pools. Could they hold the key to the question: "Is there life elsewhere in the Universe?"
