

Belly button

Scientists have recently found around 1,458 new species of bacteria hiding in belly buttons. This site is a haven for bacteria because it doesn't secrete protective oils or waxes like other parts of the body, creating the perfect conditions for growth.

Look in
a mirror
and say hello to the
90 trillion other
creatures looking
back at you!

Skin

Every inch of your skin is covered in millions of bacteria. They feed on your sweat and produce a nasty odor when they metabolize it. Smelly as they are, they actually help your skin to stay healthy by keeping more deadly forms of bacteria at bay.

~~Hands~~

Warts are caused by a virus called the human papillomavirus. They pop up in various places on your body, especially on your hands. Warts on your feet are called plantar warts.

~~Nerves~~

Some viruses lie dormant inside the body long after your symptoms have gone. The virus that causes chicken pox lingers in the nerves and can erupt years later as shingles, a painful condition that causes patches of your skin to tingle and burn.

~~Feet~~

If you wander around with bare feet at swimming pools you may pick up a parasitic fungus called athlete's foot. It thrives in the damp conditions between your toes but can spread to other areas of your body including your groin, your scalp, and under your nails.

You are not alone
