

Scientists and philosophers have been asking “What is life?” for thousands of years. It is one of the hardest questions to answer with certainty, along with the other big question:

“How did life begin?”

Theories exist but *no one is certain* exactly how and where it began. What we do know is that *Earth is 4.6 billion years old* and simple, single-celled life began 3.5 billion years ago. After that, *life became a lot more complicated!*
