Internet connection speed

Nowadays, most Internet connections are broadband, provided by digital phone lines, satellites, or fiber-optic cables. These are much faster than the connections that used to be common, provided via ordinary phone lines and a modem. Following the huge rise of working from home due to the COVID-19 pandemic, Internet speed has never been more important. Here is a selection of the download speeds in different countries in 2020. Internet users in Liechtenstein had the world's fastest broadband, with an average peak download speed of just under 230 megabits per second.

A web of connectivity

The map shows how the world's cities are connected by the Internet—the brighter the area, the more connections there are. Connections are not the same as users. Many people, for example, use a single connection in an Internet café.
