

Using the 5x table

How many altogether?

Georgia had 7 cats. Each cat had 5 kittens.
How many kittens were there altogether?

$$7 \times 5 = 35 \text{ kittens}$$

How many altogether?

Charlie had 6 boxes. He had 5 trains in each box. How many trains did he have altogether?

$$6 \times 5 = 30 \text{ trains}$$

Zoe had 3 jackets. Each jacket had 5 buttons. How many buttons were there altogether?

$$3 \times 5 = 15 \text{ buttons}$$

Yan had 8 fish tanks. Each tank had 5 fish in it. How many fish were there altogether?

$$8 \times 5 = 40 \text{ fish}$$

How many in each?

Joe had 45 pencils and 5 pencil cases. How many pencils were in each case?

$$45 \div 5 = 9 \text{ pencils}$$

How many in each?

Heather had 10 mice and 5 cages. How many mice were in each cage?

$$10 \div 5 = 2 \text{ mice}$$

Shannon had 35 sweets and 5 bags. How many sweets were in each bag?

$$35 \div 5 = 7 \text{ sweets}$$

Mark put 25 seeds into 5 pots. How many seeds were in each pot?

$$25 \div 5 = 5 \text{ seeds}$$

Children might like to draw each situation to help them visualise it, or they might like to use counters (pasta shapes) to represent the objects.

10x table

Count in 10s, colour, and find a pattern.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Write the answers.

$$1 \times 10 = 10 \quad 2 \times 10 = 20 \quad 3 \times 10 = 30 \quad 4 \times 10 = 40$$

$$5 \times 10 = 50 \quad 6 \times 10 = 60 \quad 7 \times 10 = 70 \quad 8 \times 10 = 80$$

$$9 \times 10 = 90 \quad 10 \times 10 = 100 \quad 11 \times 10 = 110 \quad 12 \times 10 = 120$$

Each box contains 10 crayons. How many crayons are there altogether?

$$2 \text{ lots of } 10 \quad 2 \times 10 = 20 \text{ crayons}$$

$$4 \text{ lots of } 10 \quad 4 \times 10 = 40 \text{ crayons}$$

$$6 \text{ lots of } 10 \quad 6 \times 10 = 60 \text{ crayons}$$

$$9 \text{ lots of } 10 \quad 9 \times 10 = 90 \text{ crayons}$$

What do children notice about the numbers in the sequence? (The tens go up in ones while the units are always 0.) Ask them to use what they know to predict whether other numbers, such as 74, 12543, and 990, are in the sequence of tens.

Multiplying and dividing

Each pod contains 10 peas. How many peas are there altogether?

How many pods? 2

$$2 \times 10 = 20 \text{ peas}$$

Work out how many peas.

$$\begin{array}{ll} \text{How many pods? } 4 & \text{How many pods? } 3 \\ 4 \times 10 = 40 \text{ peas} & 3 \times 10 = 30 \text{ peas} \end{array}$$

$$\begin{array}{ll} \text{How many pods? } 6 & \text{How many pods? } 5 \\ 6 \times 10 = 60 \text{ peas} & 5 \times 10 = 50 \text{ peas} \end{array}$$

How many pods did the peas come from?

$$30 \div 10 = 3 \text{ pods}$$

Work out how many pods.

$$\begin{array}{ll} 10 \div 10 = 1 \text{ pod} & 100 \div 10 = 10 \text{ pods} \\ 20 \div 10 = 2 \text{ pods} & 70 \div 10 = 7 \text{ pods} \end{array}$$

Dividing a number by itself often causes confusion. It would be worth getting 10 dried peas (or some other counter) and letting children share them out between 10 cups (or rings drawn on paper) so that they can actually see that $10 \div 10$ will only give 1 in each set.

Dividing by 10

One pound is the same as ten 10p coins.

How many pounds are there?

$$\begin{array}{ll} 30 \text{ coins} & 60 \text{ coins} \\ 30 \div 10 = \pounds 3 & 60 \div 10 = \pounds 6 \end{array}$$

$$\begin{array}{ll} 40 \text{ coins} & 50 \text{ coins} \\ 40 \div 10 = \pounds 4 & 50 \div 10 = \pounds 5 \end{array}$$

$$\begin{array}{ll} 90 \text{ coins} & 100 \text{ coins} \\ 90 \div 10 = \pounds 9 & 100 \div 10 = \pounds 10 \end{array}$$

$$\begin{array}{ll} 10 \text{ coins} & 20 \text{ coins} \\ 10 \div 10 = \pounds 1 & 20 \div 10 = \pounds 2 \end{array}$$

Children need to know their 10x table for this page, as it is not practical to simply count the coins out. They should realise that if they know that $8 \times$ (lots of) 10 is 80, then they also know that $80 \div$ (shared by) 10 is 8. These related facts ought to be reinforced.
