

5x

Five times clock

The **5x** table helps you to tell the time. There are **5** minutes between each number on the clock face.

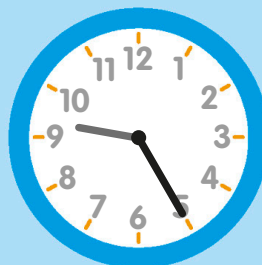

TOP TIP

You can **halve** the answers to the **10x** table to get the answers to the five times table.

$6 \times 10 = 60$. Half of **60** is **30**.
So $6 \times 5 = 30$.

If the minute hand of a clock points to **2**, that means it's **10** minutes past because $5 \times 2 = 10$.

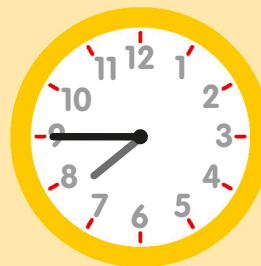

If the minute hand of a clock points to **5**, that means it's **25** minutes past because $5 \times 5 = 25$.

How many minutes past the hour is it when the minute hand points to **6**?

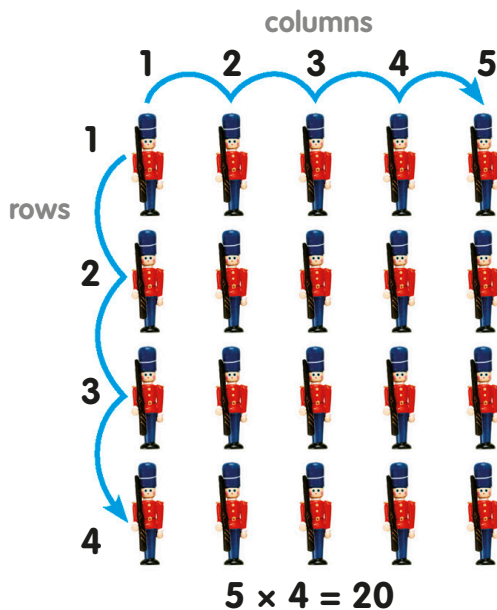

How many minutes past the hour is it when the minute hand points to **9**?

Rows and columns

You can use the times tables to count objects in rows and columns. First count how many columns there are, then count how many rows. Multiply those numbers together.

How many cars are there?
