

Fairytale division

The **7** dwarves have dug up these treasures in their mine, and want to share them out equally. Using division, can you work out how many each dwarf should receive?

They find **63** emeralds. How many does each dwarf get?

$$63 \div 7 = 9$$

They find **35** gold nuggets. How many does each dwarf get?

They find **84** rubies. How many does each dwarf get?

Count-around

Here's a trick that will help you remember **4×3** and **7×8** . If you follow the arrows around this sum, the numbers read "**1, 2, 3, 4.**"

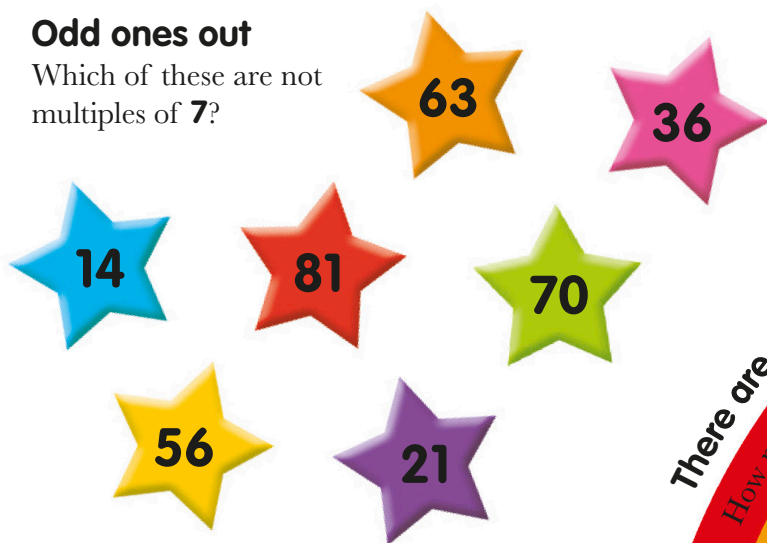

$$4 \times 3 = 12$$

The same thing works for **7×8** ! Just think: "**5, 6, 7, 8.**"

$$8 \times 7 = 56$$

Odd ones out

Which of these are not multiples of **7**?

There are seven stripes in a rainbow.
How many stripes are there in **7** rainbows?
What about **70** rainbows?
Or **700** rainbows?
