

Large fan, inside a safety cage, is spun by the engine to push the boat forward

In 2013, an airboat reached **102 mph** (163.5 km/h)—a top speed!

Shallow hull for traveling through swamplands

Airboat USA 2010s

Sailing dinghy RNSA 14 UK 1920s

Large sail made of cotton rigged to mast

Hull made of overlapping wood panels over a wood frame

Tiller

Rowboat Boy Albert UK 1920s

Oars fitted into oarlocks

Metal rudder is controlled by turning tiller

Boom is gripped for stability and to adjust sail angle to wind

Twin-bladed paddle allows kayaker to paddle continuously without switching sides

Kayaker sits in an enclosed seat

Kayak UK 1980s

Rope handles for lifting boat out of water

Single-bladed paddle used to push the water backward

Mast fits into joint on the board

Windsurfer USA 1990s

Canoe UK 1980s

oars, which pivot in fixtures called oarlocks as they are rowed back and forth. **Sailing dinghies** are used to teach people how to sail, while **airboats** offer thrilling rides, speeding along with the help of large fans spun by car or aircraft engines. **Narrowboats** were once used to haul

coal, cotton, and other goods along canals before there were train and road networks; today, they are equipped with beds and kitchens, and used for pleasure cruising. You can live aboard **cabin cruisers**, too, which travel on open water as well as canals.
