

F1 Powerboats are the ultimate speed machines on water. Equipped with monstrous 425-horsepower engines, they weigh around 1,102 lb (500 kg) and can accelerate from a standing start to 100 mph (160 km/h) in only four seconds, quickly hitting top speeds of around 140 mph (225 km/h). Inside its sleek carbon fiber body, the driver is firmly strapped

in, and protected by a crash cabin, as he pushes his powerboat to the limit. There are no gears and no brakes. It is edge-of-your-seat racing, with boats taking tight corners at 62–93 mph (100–150 km/h). Cappellini won this and four other races in the 2009 season, earning him the world-championship crown for a record tenth time.
