

Frame › This is the skeleton of the bicycle, to which all the other parts are attached. The frame is usually formed out of hollow tubes of steel for cheaper bikes, or aluminum combined with other metals (alloy), titanium, or carbon fiber for higher performance models.

Handlebars › These act as a lever for the rider to grip and turn the front wheel when steering. They also hold the gear controls, bicycle computers, and brake levers. This racing bicycle has dropped handlebars for a low, tucked-in riding position.

Stem

Brake lever

Cable guides

Fork

Water bottle held in cage

Cannondale racing bike

Spider

Pedal

Crank › The crank is a shaft connecting the pedal to the toothed chainwheel through a series of arms called a spider. The spider and chainwheels turn on the bottom bracket axle.
